                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             80
                                                                                                                                                                                                                                                                              4 Human Fas cDNA variants (AAT34527-30) are derived from alternative splicing of Fas gene transcripts. They were identified following PCR amplification of cDNA derived from the peripheral blood mononuclear cells of systemic lupus erythematosus (SLE) and angloimmunoblastic lymphadenopathy (AILD) patients and from healthy subjects. In comparison to the Fas gene (AAT34520), variant Fas del3 (AAT34529) has a deletion of nucleotides 391-637. This deletion causes frame shifting and an altered amino acid sequence (AAR99683).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ValGlnLysThrCysArgLysHisArgLysGluAsnGlnGlySerHisGluSerProThr

chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the gene expression profile; (3) detecting (M4) an inflammation (especially gene expression profile; (3) detecting (M4) an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene(s) from Gs, where the level of expression of the gene is indicative of inflammation.

(4) treating (M5) an inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by contacting a tissue having inflammation with an agent that modulates the expression of gene(s) from Gs in the tissue. M1 is useful for detecting GCA: M2 is useful for careening an agent capable of modulating GCA preferably in an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease (e.g. psoriasis, rheumatoid arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (GCA), by detecting the level of expression of gene(s) (GS) identified by DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated GC, where differential expression of GS is indicative of GCA. Also included are modulating (MX) GA by contacting GC with an agent that alters the expression of at least one gene in GS; (2) screening for an agent capable of modulating GCA or an inflammation (especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            invention relates to detecting (M1) granulocyte (GC) activation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A cDNA clone (AAT34526) codes for a membrane receptor-like protein, Fas antigen (AAR99681). It was isolated from cDNA derived from the peripheral blood mononuclear cells of systemic lupus erythematosus (SLE) and angloimmunoblastic lymphadenopathy (AILD) patients, and from healthy subjects, by PCR amplification. In addition to fascobath 4 other PCR Products were obtd. (see also AAT34527-30). These coded for soluble forms (AAR99682-85) of Fas antigen that are present at higher levels in SLE and AILD patients than the non-soluble Fas
                                                                                                                                                                                                                                                                                                                                                                          is

                   The present invention describes a method for causing apoptosis in which a fused gene consisting of a gene participating to apoptosis and a gene encoding at least the variable region of anti-idiotype antibody is transfected to a call to express the fused gene and then an idiotype antibody is reacted with the expressed cell. The method is useful in medical, pharmacoutical in paramaceutical, pharmacological and blochemical fleids. The present sequence encodes a fusion protein designated apoptobody3sc, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                      Apoptobody3sc fusion protein encoding nucleotide sequence SEQ ID NO:7.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     80
                                                                                                                                                                                                                                                                                                                                                                                    GlyTrpLeuCysLeuLeuLeuLeuProIleProLeuIleValTrpValLysArgLysGlu 20
                                                                     A cDNA library was prepared from polyA+ RNA from the human lymphoma cell line KT-3. The CDNA was ligated to BstXI-out vector pCEV4 via BstXI linkers. The KT3 cDNA library was used to transfect monkey COS7 cells which were then suspended in buffer containing murine anti-Fas Ab. The cells were panned on plates pre-coated with goat anti-mouse antibodies. The Fas-expressing cells adhered to the plates. Extrachromosomal DNA was prepared from adhered cells and used to transform E.coli VMIO0 cells. A 520bp XhoI-BamHI fragment from a positive clone (PF3) was used to screen the KT-3 cDNA library. The longest cDNA clone was designated pF58 and contains an ORE corresp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ValGlnLysThrCysArgLysHisArgLysGluAsnGlnGlySerHisGluSerProThr

                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                           윱
                                                                                                                                                                                                                          පු
                                                                                                                                                                                                                                                                                                                                                 ò
This sequence represents the coding sequence for the human Fas antigen contained within the plasmid pCEV4/hEas. The soluble Fas antigen is included in the immunoasay kit of the invention. The kit is for the assay of soluble Fas antigen and contains an immobilised anti-soluble Fas monoclonal antibody, as well as the standard soluble Fas antigen encoded by this sequence. The assay is simple and has high accuracy, high sensitivity, and is capable of assaying a number of different specimens at the same time. The immunoasay is used on biological samples (such as serum) and is useful for diagnosis of autoimmune diseases such as
                                                                                                                                                                                                                                                                                                                                                                  Fas; antigen; immunoassay; monoclonal antibody; autoimmune disease; SLE; rheumatoid arthritis; serum; systemic lupus erythematosus; ss:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunoassay method for soluble Fas antigen in body fluids - for diagnosis of auto:immune diseases such as rheumatoid arthritis and systemic lupus erythematosus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     rheumatoid arthritis or systemic lupus erythematosus (SLE)

                                                                                                                                                                                                                                                                                                                                                                             LeuAsnProGluThrValAlalleAsnLeuSerAspValAspLeuSerLysTyrIleThr
                                          Fas antigen derivative containing modified extracellular region has low antigenicity, promotes apoptosis and is useful in treatment off viral and other diseases
                                                                                          The present sequence was used in the development of novel Fas antigen derivatives, which contain a Fas antigen extracellular region lacking one or more amino acid residues in the region from the amino-terminal to (but excluding) the 1st cysteine residue (preferably at least 29 residues are deleted).

The derivatives are effective regulators of apoptosis and can be used (either by administration of the polypeptide, or by the use of the coding DNA in gene therapy) to treat a range of diseases, e.g. diabetes, arthritis, lupus and in particular viral diseases such as hepatitis, influenza and HIV, by modulating apoptosis of
                                                                                                                                                                                                   Sequence 2534 BP; 817 A; 491 C; 499 G; 727 T; 0 other;

The present sequence represents a Fas cDNA sequence used in the method-of the invention. The method is concerned with reducing depletion of activated Fas-expressing CD8+ T-jumphocyte killer (TK) cells in an immune cell population which also comprises of Fas-ligand (FasL)-expressing activated CD4+ cells. It involves contacting this immune cell population with an effective amount of an agent (e.g. a soluble Fas-Fc fusion protein) which would interfere with the interaction between Fas and FasL. Therefore, the method is useful for dentifying suitable agents which can reduce depletion of activated Fas-expressing CD8+ TK cells in immune cell populations. Also claimed is the use of the agent in the manufacture of therapeutic compositions. Apoptosis of lymphocytes can be triggered by the interaction of the this interaction, the method described and its preparations can prevent apoptosis of CD8+ TK lymphocytes caused by expression of FasL on expectably the result of CD4+ cells. Such FasL-expression activated CD4+ cells. Such FasL-expression with an immunodeficiency virus e.g., human immunodeficiency virus (HTV) or simian immunodeficiency virus e.g., human immunodeficiency virus (HTV) or simian immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              naintenance/regeneration of cytotoxic T lymphocyte (CTL) activity towards the CD4+ cells infected with the infectious agent, enabling treatment (prophylactic and/or therapeutic) of immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Reducing CD8+ lymphocyte apoptosis to treat e.g. immunodeficiency diseases - by interfering with interaction of Fas with Fas-ligand expressed on activated CD4+ cells, e.g. cells infected with HIV
                                                                   Fasl;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  80
                                                                                                                   The present sequence encodes human Fas (Apo-1). The specification describes antisense compounds which are targeted to the 5 -untranslated region, translational start site, translational termination region or 3'-untranslated region of incletc acid molecules encoding Fas, Fas ligand (Fast), or Fap-1 (Fas associated protein 1, protein tyrosine phosphatase). The antisense compounds are used to inhibit the expression of Fas, Fast or Fap-1 in cells or tissues. They are used to treat autoimmune or inflammatory diseases such as hepatitis. They can also be used to treat cancer, especially colon, liver or lung
antisense oligonucleotides for treating hepatitis and colon, liver or lung cancer are inhibitors of Fas, Fas ligand or Fas associated protein

The promoter is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               comprising an inducible epsilon promoter-chimeric Fas-IRES-hygromycin-bovine growth hormone poly-A tail placed in vector (12s backwards so that no leaky transcription occurs through the CMV promoter. It is an example of a death gene that provides a nucleic acid that encodes a protein which causes a provides die. The death gene can be used as a reporter gene in methods of the invention used to screen for modulators of IgE synthesis, secretion and switch rearrangement. The method

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           LeuAsnProGluThrValAlalleAsnLeuSerAspValAspLeuSerLysTyrIleThr 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compound targeted to nucleic acid encoding Fas, Fas ligand or Fas associated protein-1 is useful for inhibiting expression of Fas, Fas ligand, or Fap-1 in cells or tissues, and for treating hepatitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GTACAGAAAACATGCAGAAAGCACAGAAAGGAAAACCAAGGTTCTCATGAATCTCCAACC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to an antisense compound encoding Fas, Fas ligand, or Fas associated protein-1 (Fap-1). The inhibition of Fas mediated signalling is thought to be immunosuppressive, antiinflammatory, hepatotropic, cytostatic and vasotropic. Antisense oligonucleotides were designed to target human Fas. Oligonucleotides were synthesised as chimeric oligonucleotides and are useful for treating an animal having an autoimmune or inflammatory disease e.g., hepatitis, cancer, a condition associated with apoptosis, allograft rejection, or ischemia reperfusion injury. Optionally, the above mentioned conditions are prevented by contacting the allograft with the antisense oligonucleotide. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      oligonucleotides are used in diagnostics, therapeutics, prophylaxis and as research reagents and in kits. The oligonucleotides are also useful for research purposes. The present nucleotide sequence is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 80
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ы
                                                                                                                                                                          The present sequence is that of survival construct C12ScFas in which the interleukin-4 inducible epsilon promoter-chimeric Fas(CD95)-internal ribosome entry site-hydromycin-bowine growth hormone polyA tail is placed in the C12s vector backwards so that no leaky transcription occurs through the CMV promoter. Methods of the invention utilise diphtheria toxin for screening purposes, especially for identifying modulators of 1gB synthesis, secretion and switch rearrangement. A claimed method of screening for bloactive agents capable of inhibiting the IL-4 inducible epsilon promoter (see AAF30941), which is involved in 1gE switching, comprises: combining a candidate bloactive agent and a cell that does not endogenously express heparin-binding epidermal growth cactor-like growth factor (HBBGF) and which comprises a fusion nucleic acid comprising the IL-4 inducible epsilon promoter and nucleic acid encoding HBBGF, inducing the promoter with IL-4; adding diphtheria toxin to the cell; and determining whether the cell is dead. Survival constructs carrying a death gene and a dring diphtheria toxin to the cell; and determining whether the cell is dead. Survival constructs carrying a death gene and a dring dentified that prevent the production of 1gE synthesis can be identified that prevent the production of 1gE and reduce or eliminate an allergic response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 GlyTrpLeuCysLeuLeuLeuLeuProlleProLeulleValTrpValLysArgLysGlu
